REPORT ON THREE WEBSITE DESIGNS

A visual review of an online shopping, travel booking, and food ordering website

Prepared from the screenshots provided

1. Introduction

This report reviews three website interfaces shown in the supplied screenshots. The websites represent common online services: product shopping, bus and train booking, and food ordering. The review focuses on the visible layout, navigation, content presentation, and user interactions suggested by the screens. It is based on screenshots only; the underlying code, mobile responsiveness, data handling, and actual booking or payment functionality have not been tested.

2. Website 1 – Elegence

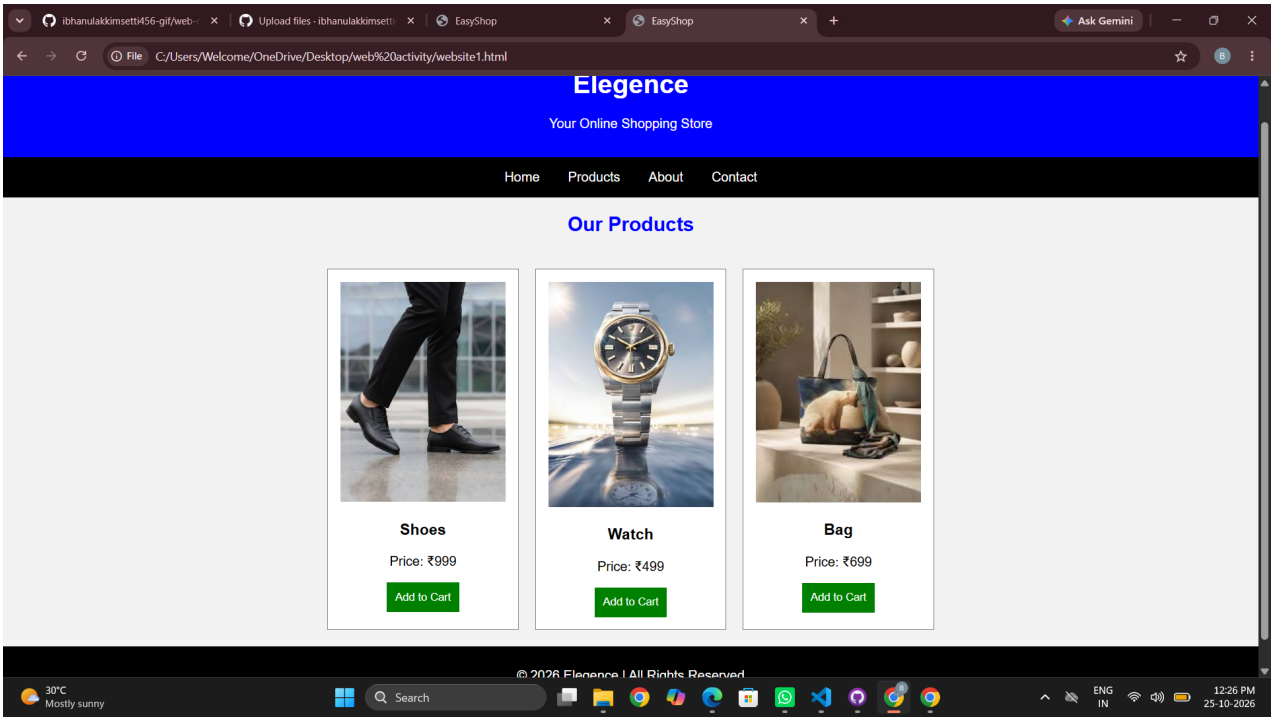

Purpose and content: Elegence is presented as an online shopping store. The visible product section contains three product cards: Shoes (■999), Watch (■499), and Bag (■699). Each card includes a product image, name, price, and a green “Add to Cart” button.

Design and navigation: The page uses a blue header with the store name and tagline, a black navigation bar with Home, Products, About, and Contact, and a light-gray product area. The three cards are aligned in a row, making the product choices easy to scan.

Strengths: Clear product imagery; visible prices; consistent card layout; prominent calls to action; simple navigation.

Potential improvements: Correct the apparent spelling of “Elegence” if “Elegance” is intended; add product descriptions and availability; provide cart feedback and a cart summary; improve accessibility with descriptive image alt text and clear keyboard focus; test contrast and responsive behavior on smaller screens.

Website 1: Elegence – Online Shopping Store

3. Website 2 – Travel Easy

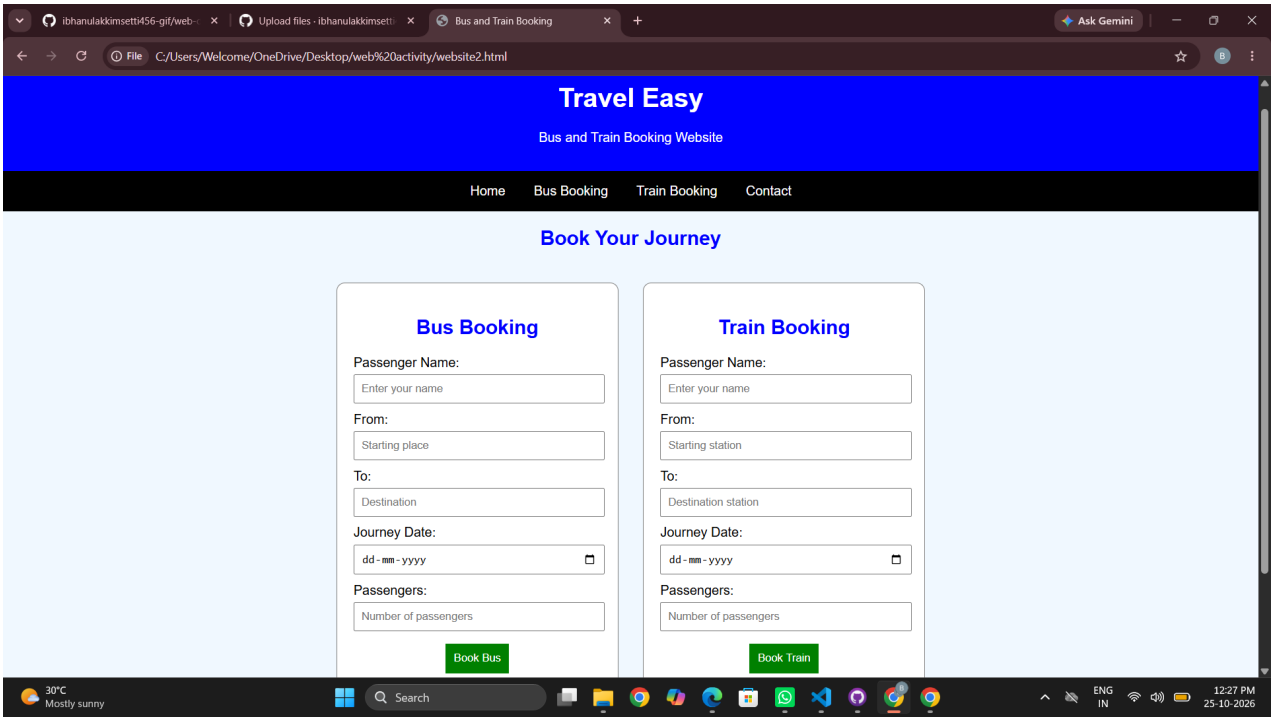

Purpose and content: Travel Easy is presented as a bus and train booking website. Its main section has separate Bus Booking and Train Booking forms. Both forms visibly request passenger name, origin, destination, journey date, and number of passengers, followed by a booking button.

Design and navigation: The page uses a blue title header, black navigation bar, and pale-blue content background. Two bordered form panels sit side by side, allowing users to compare the bus and train options.

Strengths: The two travel modes are clearly separated; form labels are visible; date fields use a date-picker control; the required travel details are presented in a familiar sequence.

Potential improvements: Add input validation and helpful error messages; use dropdowns or searchable suggestions for stations and locations; validate dates and passenger counts; explain fares, availability, and cancellation rules before confirmation; show a review step and booking reference; ensure the layout stacks cleanly on mobile. The screenshot alone does not establish whether bookings are processed or stored.

Website 2: Travel Easy – Bus and Train Booking

4. Website 3 – Foodie's Center

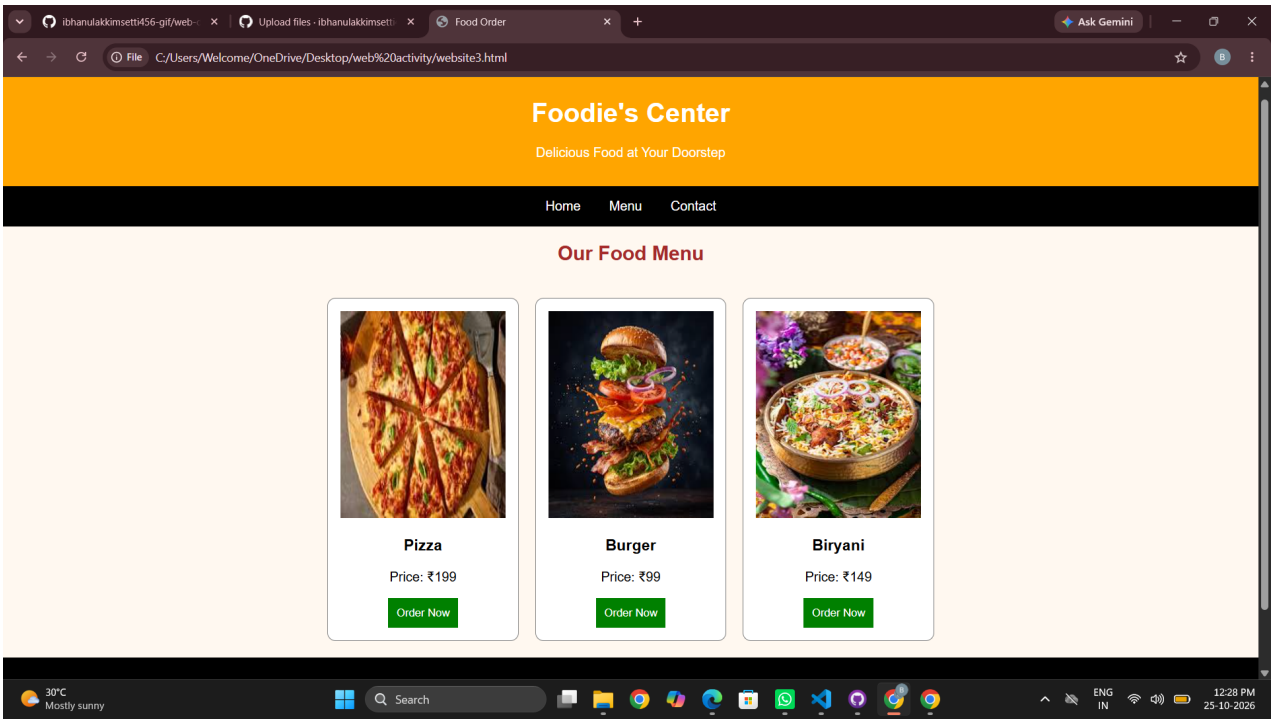

Purpose and content: Foodie's Center is presented as a food ordering website with the tagline “Delicious Food at Your Doorstep.” The visible menu shows Pizza (■199), Burger (■99), and Biryani (■149). Each menu card includes a food image, item name, price, and green “Order Now” button.

Design and navigation: The site uses an orange header, black navigation bar, cream-colored content area, and a dark-red menu heading. Three food cards are arranged in one row.

Strengths: Food photography draws attention; item names and prices are easy to find; the repeated card pattern is familiar; order buttons stand out.

Potential improvements: Include ingredient and portion details, vegetarian/allergen information where applicable, customization options, delivery estimates, and availability; provide cart/order summaries and confirmation; make navigation and buttons accessible by keyboard; check color contrast and responsive layout.

Website 3: Foodie's Center – Food Ordering

5. Comparative Review

All three sites use a straightforward header, navigation bar, central content heading, and repeated content panels. Elegence and Foodie's Center emphasize image-led product selection, while Travel Easy emphasizes form completion. The first and third sites use green action buttons; Travel Easy uses the same style for booking actions, creating some visual consistency across the examples. Their strongest common feature is simplicity. Their main shared opportunity is to make the next step clearer through validation, confirmation feedback, accessibility improvements, and mobile-friendly layouts.

6. Summary Comparison

Elegence is a catalogue-style shopping interface, Travel Easy is a dual-form travel interface, and Foodie's Center is a menu-style ordering interface. Each communicates its primary purpose quickly. Based on the visible screens, the shopping and food pages are strongest at presenting choices, while the travel page is strongest at collecting structured user input. This is a visual assessment, not a test of live functionality or security.

7. Conclusion

The three screenshots show simple, understandable website concepts for shopping, travel booking, and food ordering. Consistent spacing, readable labels, visible prices, and prominent buttons support usability. To move from demonstration interfaces toward production-ready services, the sites should add robust validation, meaningful confirmation states, accessibility support, responsive design, and clear information about availability and next steps. Functional testing would be required to confirm whether the buttons, forms, and navigation work as intended.
